

Makes MFPs easy to use for disabled workers

Lexmark Accessibility Solution and Lexmark Accessibility Speech

Business Challenge:

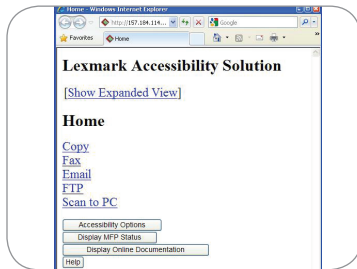

Need for disabled workers to be able to use MFPs.

Lexmark's Advantage:

MFP touch screens can be difficult for disabled employees to use. Disabled workers, such as those with vision impairments, will find it easy to use Lexmark MFPs with **Lexmark Accessibility Solution**. The web-based software is designed to enable users with disabilities to set up and complete copy, fax, e-mail, ftp, and scan job directly from their browser, rather than from the MFP touch screen.

Also designed to assist visually impaired users, **Lexmark Accessibility Speech** is a unique application that provides users with audio messages regarding the device status.

Features

Web-based alternative to MFP touch screens

The Lexmark Accessibility Solution allows disabled employees to set up job commands, normally completed at the MFP, from a browser. Once set up, the task is assigned a job number. The employee completes the task by entering the assigned number at the MFP using the accessible number keypad.

Compatible with popular accessibility software and PDAs

The software is designed to work well with accessibility products such as GW Micro Window-Eyes; Freedom Scientific JAWS® and MAGic®, Ai Squared's ZoomText; accessible PDA devices such as HIMS Voice Sense and Braille Sense; Apple iPhone and industry standard speech recognition software. Disabled employees can leverage the power of these accessibility tools to access the functions of Lexmark MFPs.

Custom audio status messages

With more than 60 messages available, administrators can create different prompts for employees with various levels of vision impairment. By pressing the * and 0 buttons on the keypad, an audio message related to the device status is played through the onboard speaker. This makes it easier for employees to independently resolve issues and reduces the need for verification from others about errors.
